While Clenbuterol has a half-life of 7-8 hours, Albuterol stays in your system for just 3-4 hours. In other words, Albuterol has a shorter half-life as compared to Clenbuterol. Increase in Strength. One of the differences between Clenbuterol and Albuterol is their effect on your strength. Clenbuterol has a half-life of about 48 hours, while albuterol has a half-life of just about 6 hours. There is an upside and downside to the half-life to both of these drugs. The long half-life associated with clenbuterol will allow a person to dose less often with the drug still staying active in the system and doing its job with burning body-fat.

Clenbuterol and Albuterol side effects, although are similar, is most likely you would receive them from Clenbuterol taken in consideration that is an overall more powerful compound. Albuterol is less effective at burning fat and is almost not having any effects on maintaining lean muscle mass as Clenbuterol would, but instead is much less likely to offer negative side effects and even if they.

Albuterol and clenbuterol are used to treat asthma and COPD. Clenbuterol has also been used for muscular purposes and weight loss. The dosage for both depends on the medical condition. Clenbuterol is more effective but has greater potential side effects. [web site](#)

Clenbuterol. Albuterol. Mechanism of Action: beta-2 adrenoceptor agonists. Causes a breakdown of fatty acids into the bloodstream to be used as fuel. With this stimulation, there will be an increase in heart rate and body temperature. Used For: treating asthma and shredding fats:
Kaladin. Member. lukk3395 said: Clenbuterol is a better beta receptor antagonist. Tho I would run it with a low dose of T3. There are plenty of studies that show that thyroid hormone is synergetic with beta

antagonist and it helps clear paths of adrenergic receptors as well as speeding up the metabolism.

Albuterol closely resembles to Clenbuterol, which is a reliable lipolytic (fat burn) steroid. The only difference is that the former drug has a shorter life period than the latter one. The most important and interesting fact about Albuterol Sulfate is that it is available in various forms, such as inhalers, solution (inhaled using a nebulizer). Albuterol is a (relatively) selective beta-2 adrenoreceptor agonist, just like Clenbuterol. Honestly, I had pretty much given up on Clen a couple of years ago because for my own personal reasons (I had experienced much better results with Ephedrine and Caffeine).

Albuterol, like its closely related chemical cousin clenbuterol, is an asthma medication that has been adopted by athletes and bodybuilders as an ergogenic aid. Like clenbuterol, albuterol binds to the so called beta 2 adrenergic receptors found on cells throughout the body. The beta 2 receptors on fat cells activate an enzyme called hormone. [see it here](#)
