

## Raising the Bar on Forage Production

---

When you want to take your Forage crops to the **NEXT LEVEL**, we have 2 options for your consideration that have consistently worked well to improve yield and quality.

The **1st option is a FOLIAR application**, that works best when good fertility levels are already in place.

These applications often increase the yield and quality of the next cutting or grazing by 10-20%. Typically, these applications include 3-6 gallons per acre of nutrient product or mix and 1-2 gallons per acre of a biological like **MVP**.

In total, these applications add up to a spray volume of **15-25** gallons per acre.

---

If you're an Organic Grower, you may want to consider these popular applications:

- 3-5 gallons per acre of **Pillar**
- 1-2 gallons of **Dramm Fish**
- 2 gallons per acre of **MVP**, a biological.

**Other successful combinations may include applications of:**

- **N-Force** when more nitrogen is needed for grass production
- **K-Pak**, which contains potassium acetate
- **Forage Boost**, a calcium based product, that works well where phosphorus and potassium soil fertility are adequate
- **A Micronutrient Package** is an ideal addition for most sustainable growers

## Stream Nozzle

**The 2nd option is a STREAM application.**

This is our recommendation when the fertility is low or when a grower wants to use an all liquid fertilizer program in place of dry fertilizer.

Streaming places the fertilizer in narrow bands approximately 6-7 inches apart. This is accomplished by using Stream Jet nozzles.

This technique allows the use of higher rates of fertilizer without burning the leaf foliage.

**A STREAM application may include the following:**

- 3-6 gallons per acre of 4-21-4 or AgriBoost PK or K-Pak
- 4-8 gallons per acre of KTS (0-0-25-17S)
- 2-3 gallons per acre of **MVP**
- Additional carbons and micronutrients may also be needed.

**Both FOLIAR and STREAM applications**

should be done after each cutting for maximum performance.
