

## ***More Great Plot Results***

*11/11/2013*

Every year we get reports of great results from growers who do yield checks with SP-1™ and AgriEnergy Resources nutrient blends. Here are a couple more reports.

### **Report #1**

In 2013 an organic family farm in Wayne County, Ohio, repeated this history of success. The field was wheat in 2012, followed by a clover cover crop. The whole field received both dry and liquid dairy manure. **Myco Seed Treat™**, **SP-1™** and **PKT Blend 13** were applied to most of the field on the planter, with checks where the SP-1™ and PKT Blend 13 were turned off. Here are the results:

Control	180.9 bushels/acre
With <b>SP-1™</b> and <b>PKT Blend</b>	206.6 bushels/acre
<b>Increase</b>	<b>+ 25.7 bushels/acre</b>

Also very positive was a *3.7% decrease* in grain moisture at harvest. Our dealer commented that right up until harvest the treated strips looked taller and greener with a brown husk on a still-green plant, a sign of healthy dry-down.

Our dealer in this Ohio county has conducted similar trials with other area farmers over the past six years using SP-1™ and similar nutrient blends. **The 6 year average of these trials, over greatly different growing seasons, is +21.9 bushels per acre with the SP-1™ and nutrients!** Plus, the six year average of nearly 2.0% lower moisture at harvest can represent an additional savings of up to \$15 per acre!

### **Report #2**

At another farm in Ohio, the grower used SP-1™ and AgriEnergy Resources blends in both planting and sidedress applications. He ran a check by turning off the planter mix of **SP-1™** and **PKT Blend 13**; sidedress was applied to the whole field. **Where the planter mix was turned off, yields dropped from 215.5 down to 204.0 bushels per acre; an 11.5 bushel difference.** This reinforces our belief that there is a benefit to multiple applications of biology, both at planting and during plant growth.

### **One More Success Story...**

**Congratulations to Daniel Olson**, Lena, Wisconsin, for winning **Grand Champion** in the Baleage Division of the World Forage Analysis Superbowl Contest at the World Dairy Expo in October!! Daniel's fertility program on the winning grass and clover field consisted of two applications of **SP-1™**, **Dramm ONE**, and **Potassium Sulfate Solution**. Prize-winning proof that foliar feeding biology with a nutrient package makes top quality forage!
