

Managing Soil Biology

There are many reasons for adding biological products to your crop plan. The right microbes in the right places at the right times can result in:

- Improved mineral supply to the plants
- Improved soil conditions for greater root growth
- The plants feeding the microbes through root exudates
- More soil aggregates, leading to improved tilth and more air in the soil
- Improved water infiltration and soil water holding capacity
- Increased plant resistance to yield-limiting environmental stresses
- Reduced fertilizer needs

BUT... Biological products are not magic bullets. There is not one biological product that works for all crops, all climates, and all types of soil.

Biologicals need to be managed.

That's where we come in! **AgriEnergy Solutions** offers a line of biological products that we humbly believe to be the best bios on the market. And our staff has more than 100 combined years of experience in when, where, why and how to use each one of them.

AgriEnergy Solutions offers you not only a full product line of **liquid solutions** for increasing and managing your soil biology, but we also offer **solid solutions** and recommendations for your specific situation.

Our team started selling biological products in 1988, after several years of conducting on-farm research, and before very many others jumped on the biological bandwagon. Our products and our recommendations have stood the test of time.

There are still opportunities to get biology into your soils and/or onto your growing crops in 2021. Let us help you plan and manage timely applications of biological products on your farm.

Sincerely,

Your AgriEnergy Solutions Team
