

Early Foliar

5/24/2018

Another planting season is wrapping up. As we look ahead to the growing season, *consider applying an early foliar during the V-2 to V-5 time frame*. We've seen some great success with early season foliars. If you're wondering what you could be doing here's what we'd recommend:

- *For conventional growers...***Accelerator** has shown great results when applied at 3-4 gallons/acre. It's a complete package including nitrogen, phosphorous, and potassium along with some zinc, manganese, boron, copper, iron, magnesium, and carbons.
- *For organic growers...***Pillar** is a great option when applied at 3-4 gallons/acre. It's a complete blend including nitrogen, phosphorous, potassium, zinc, manganese, boron, copper, and various carbon sources.
- *For all growers...*1-2 gallons/acre of **SP-1™** can be added to any foliar application to boost effectiveness; but if you're needing a specific micronutrient, our Biomin line of trace minerals can be added into the tank as well. If you're looking for an adjuvant to help the plant better absorb essential nutrients, we'd recommend Wake-Up Summer for conventional growers and OroBoost for organic crops.

Your AER rep can work with you to come up with a foliar plan of attack. Don't have a rep? Call our main office **815.872.1190** and we'll direct you to the right person!
