

Greetings from our blog!

It is our pleasure to write articles about technology-related topics as a group of technology enthusiasts. Android, Linux, and Windows are among the topics we write about most, although we do cover other topics as well. Having started [this blog](#) in 2019, we strive to help the tech geek community find solutions to their gadget-related problems. In the time since this blog was established, it has gained a considerable amount of popularity.

In this blog we have covered the following topics:

- Termux (A linux based terminal for android)
- Magisk (Rooting an Android device)
- Windows OS
- Linux
- Android
- Others

Here are the articles we have published so far.

#1. **Termux tutorials**: Termux is a linux based application that is popular across all Android devices. There is a popular thread on a variety of online forums devoted to this extremely powerful application. In order to automate some processes, we needed an application that could connect to a linux server via ssh during the development of one of our web applications. There was only one program that provided an upload and download tool, which is termux.

Our favorite application for automating work processes, we use it extensively. In the past few years, we have written a few articles about it.

#2. **Magisk** (Systemless Root for Android): Magisk is a popular and very helpful tool that can be used to root your Android device without modifying the system files. Maybe you already know about it.

Xposed framework, battery management, RAM management, and fake location are a few options that you can customize your Android device with Magisk.

#3. **Windows OS**: One of the most user-friendly operating systems designed for office use. Many customized features and customizations have been added by Microsoft over the years. However, it cannot be compared to Ubuntu, Kali or any other linux distribution.

While attempting to install a third-party app, you might run into some problems.

#4. **Android**: For general category articles, we created an Android category on our blog. Magisk and termux, however, have been tagged separately since these applications have more clout than the other applications. We offer a wide variety of articles besides termux and magisk here.

#5. **Others**:

We have left this category on our blog as a remnant. Articles that we couldn't categorize under the categories listed above are included in this category. A collection of articles related to a range of daily problems and issues can be found here. Among the topics covered are Internet hacks, browser hacks, social media, free downloads, Google Drive, and programming related material.

Those categories aren't exclusive, but inclusive instead. As well as covering other topics, we are trying to include others.

We are what we are because of our avid readers. As we embark on this blogging journey, we are not trying to make money, but rather to serve the general public with useful content. We typically discuss with readers and other tech professionals issues that they face on a daily basis. In addressing these issues, we will then write useful content.

The hopes we have for this blog are that you will find it of great use and you will share it with your social media friends.

I would appreciate some feedback and suggestions if you would like to share them with me. You can contact us here [admin\[at\]onegyd\[dot\].com](mailto:admin@onegyd.com)
